DETAILED ACTION

Election/Restrictions

1. Applicant's election of claims 1-9 in the reply filed on Feb. 11, 2005 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lee et al (US Patent 6,793,756) in view of Horvath (US Patent 5,250,146).

Lee discloses a substrate bonding apparatus. As shown in Fig. 3, the apparatus comprises bonding chamber 110, vacuum unit 200, upper stage or retaining table 121 and lower stage or retaining table 122. Upper stage 121 includes electrostatic chuck 121a and vacuum holes 121b for receiving and holding substrate 520 there against. Lower stage 122 includes electrostatic chuck 122a and vacuum holes 122b for receiving and holding substrate 510 (see col. 9, lines 1-15). Motor 133 then drives upper stage 121 toward lower stage 122 to press and bond the materials there between. Fig. 4 shows the face of stage or retaining table 122 including a plurality of pieces of

electrostatic chuck 122b separated by support parts 410a and 410b and vacuum holes 122b.

However, Lee does not disclose the elastic material as claimed by the applicant. Regarding this difference, the applicant is directed to the reference of Horvath.

Horvath discloses an apparatus for laminating materials. As shown in Fig. 1, the apparatus comprises lower saddle or ram 12 and upper ram 14. Upper ram 14 is provided with a layer 16 of silicone rubber having a Shore hardness of 35 to 65 (see col. 11, lines 29-31). Such a material inherently allows the pressing surface of the ram to deform to accommodate irregularities without damaging the materials being pressed. For these reasons, it would have been obvious to one having ordinary skill in the art to employ a silicone rubber material having a Shore hardness of 35 to 65, as taught by Horvath, in the apparatus disclosed by Lee.
